Trees

Trees are collection of nodes and edges

If there are 'n' nodes then there are (n-1) edges

where One of the node is Root node and the rest of the nodes are divided into disjoint subset and each subset is a tree Or Subtree

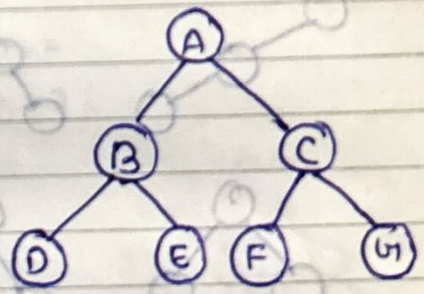
Terminology

1. Root 2. parent 3. child 4. Siblings
5. Descendents 6. Ancestors 7. Degree of NODE
8. Internal node (Non-Leaf node) / External node (Leaf node) 9. Levels
10. Height 11. Forest.

① Binary Tree

A tree having degree - '2'

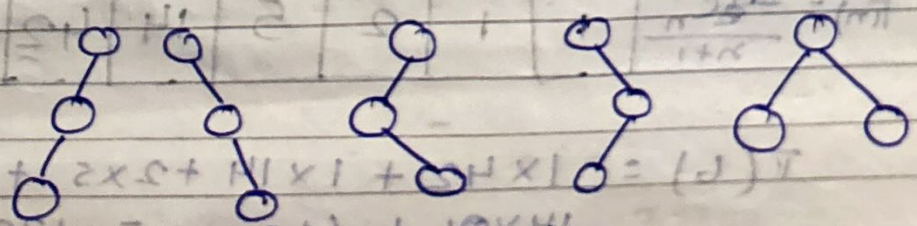
Children can be {0, 1, 2}



Number of Binary Tree.

1. Unlabelled Node → ○ ○ ○
2. Labelled Node → (A) (B) (C)

If n = 3 then how many BT can be generate?



T(3) = 5

$T(n) = \frac{2nC_n}{n+1}$ (Catalan number) (n=3) Max height = 4 = 2^2

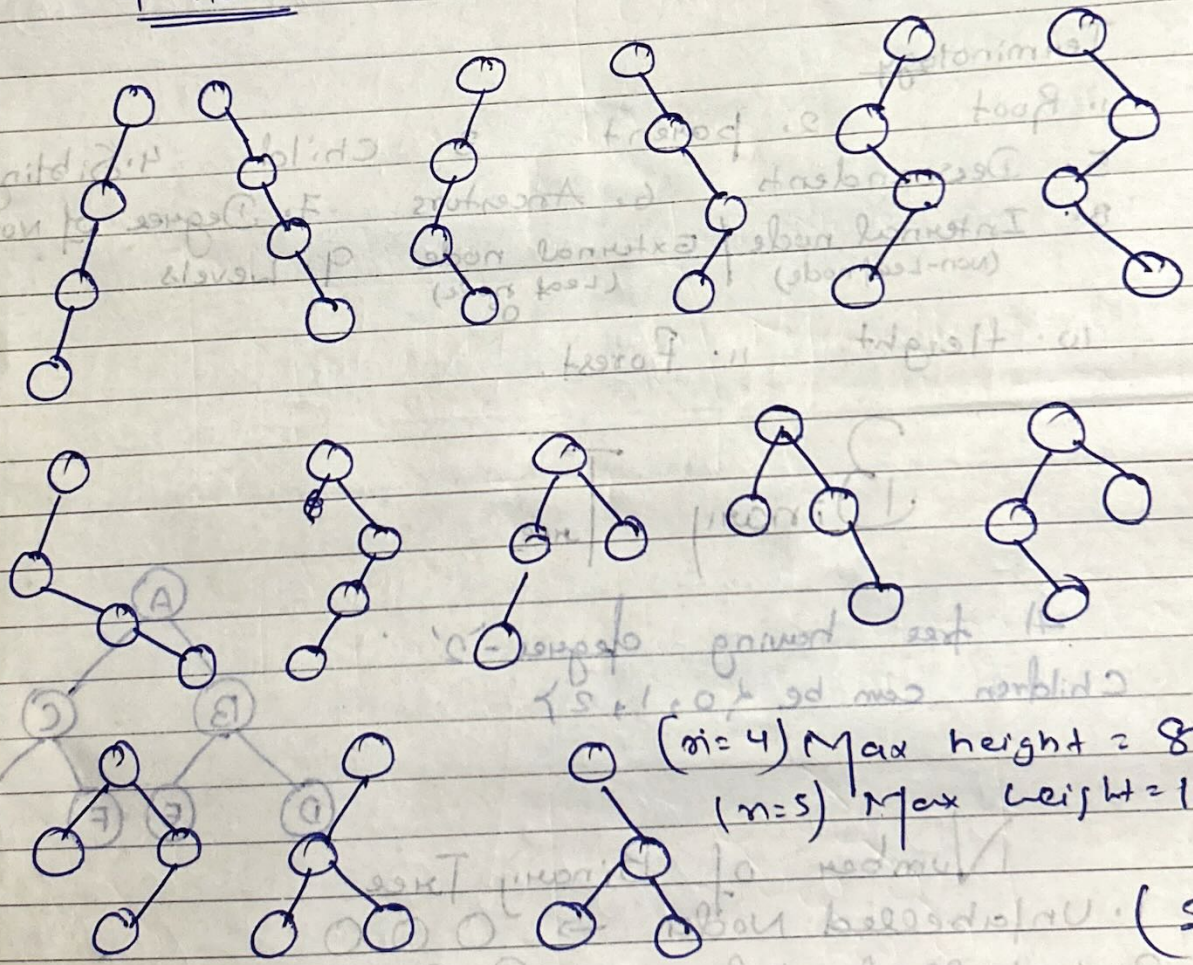
(2)

⊙ $T(4) = \frac{2n C_n}{n+1} = \frac{2 \times {}^4C_4}{5} = \frac{{}^8C_4}{5}$

$= \frac{8 \times 7 \times 6 \times 5}{4 \times 3 \times 2 \times 1} / 5 = 14$

⊙ $T(5) = \frac{{}^{10}C_5}{6} = \frac{3 \times 2 \times 7}{} = 42$

4 node



(n=4) Max height = $8 = 2^3$

(n=5) Max height = $16 = 2^4$

(2^{n-1})

n	0	1	2	3	4	5	6
$T(n) = \frac{2n C_n}{n+1}$	1	1	2	5	14	42	132

$T(6) = 1 \times 42 + 1 \times 14 + 2 \times 5 + 5 \times 2 + 14 \times 1 + 42 \times 1 = \underline{132}$

$T(6) = T(0) \times T(5) + T(1) \times T(4) + T(2) \times T(3) + T(3) \times T(2) + T(4) \times T(1) + T(5) \times T(0)$

$$T(n) = \sum_{i=1}^{n} T(i-1) * T(n-i)$$

For Labelled Node
No. of B.T

Ex. 
↳ 6 = 3!

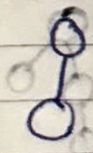
$$T(n) = \frac{^{2n}C_n}{n+1} * n!$$

Height Vs Nodes

⊙ How many no. of nodes are possible ? →

Height h=1

min



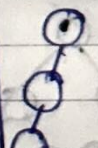
n=2

max

n=3

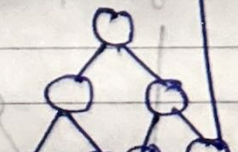
Height h=2

min



n=3

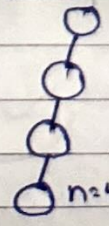
max



n=7

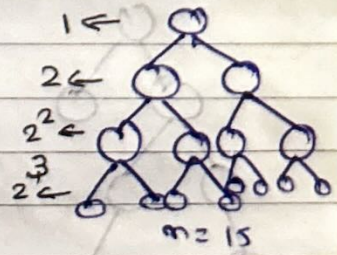
Height h=3

min



n=4

max



n=15

Min node (n) = h+1

Sup = $a + ar + ar^2 + ar^3 + \cdots + ar^k$

$= a\frac{(r^{k+1}-1)}{r-1}$

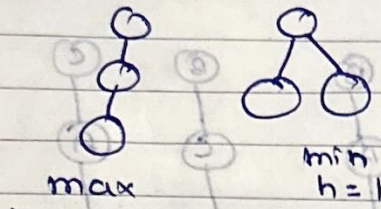
$= 1\frac{(2^{h+1}-1)}{2-1}$

Max node = $2^{h+1}-1$ ∎

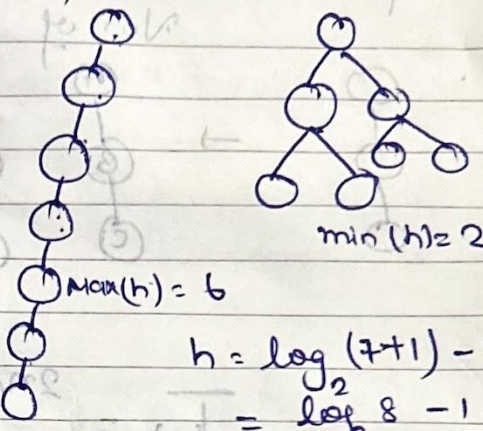
(4)

If no. of nodes are given find what is the min^{m} height and max height ?

→ Node (n) = 3



(n) = 7



$h = \log_2(7+1) - 1$

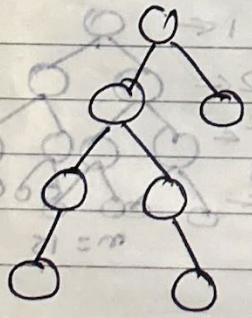
$= \log_2 8 - 1$

$= 3 - 1 = 2$

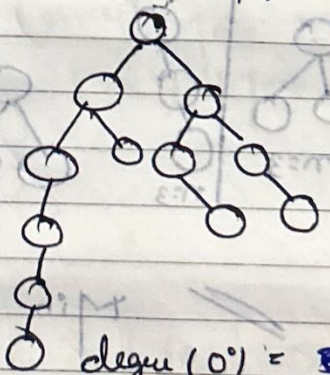
If height is given	If Nodes are given	Range
Min Node $n = h+1$	Min Height = $\log_2(n+1)-1$	$O(\log n)$
Max Node $n = 2^{h+1}-1$	Max Height = $N-1$	$O(n)$

Internal Node & External Node

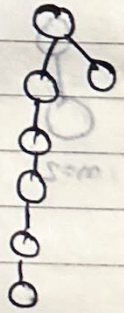
find degree of node Aq to Nodes



degree (0°) = 3
degree (1°) = 2
degree (2°) = 2



degree (0°) = 4
degree (1°) = 5
degree (2°) = 3



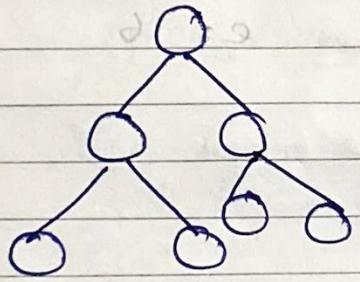
degree (0°) = 2
degree (1°) = 4
degree (2°) = 1

$$\deg(0) = \deg(2) + 1$$

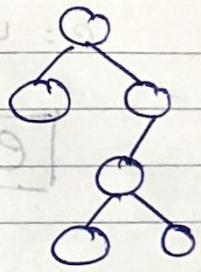
Strict Binary Tree

A general Binary Tree can have {0, 1, 2} children, but S.B.T It should not and any Node with degree '1'.

Only had {0, 2}

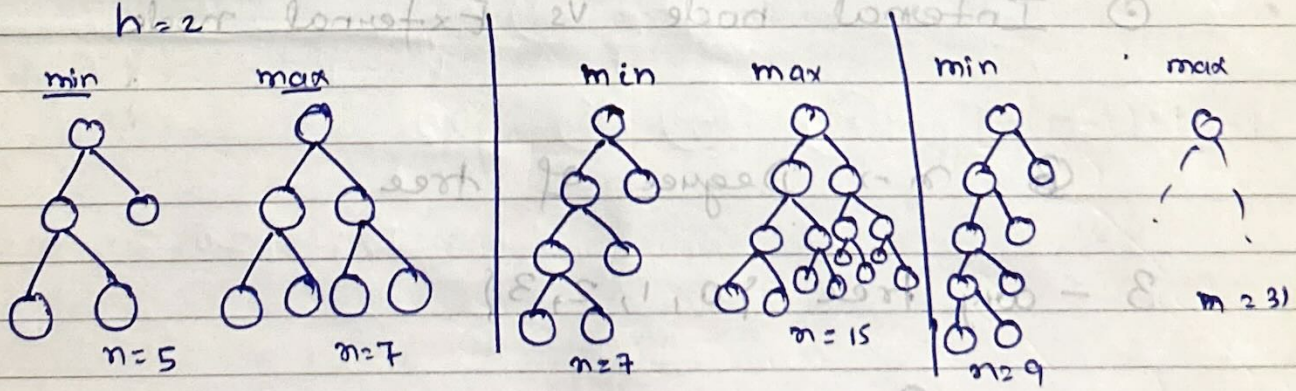


SBT ✓



NOT SBT ✗

Height vs Node of S.B.T



If 'h' is given:

Max^m no. of node are same as Binary tree formula

Max^m no. of node (n) = $2^{h+1} - 1$

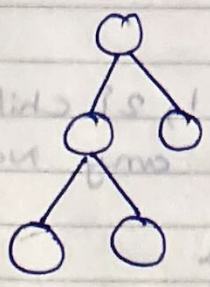
Min^m node (n) = $2 \times h + 1$

If nodes are given:

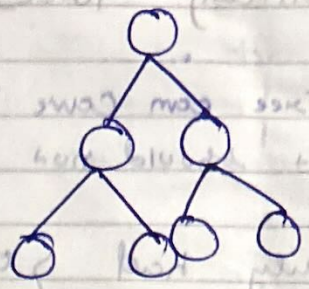
Max^m height (h) = $\frac{n-1}{2}$

Min^m height (h) = $\log_2(n+1) - 1$

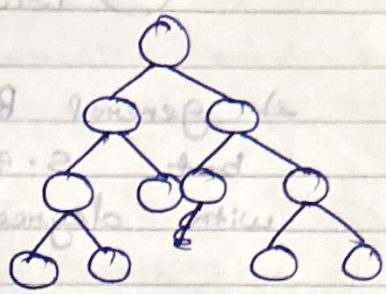
Internal node vs External Node



i = 2
e = 3



i = 3
e = 4



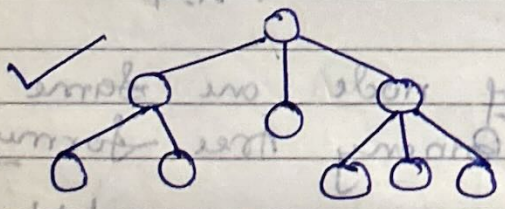
i = 5
e = 6

$$e = i + 1$$

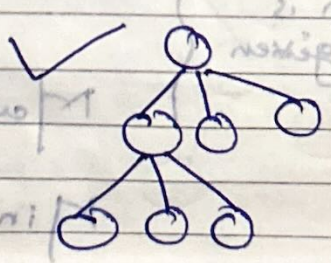
- What are n-ary Tree
- Strict n-ary tree
- Height vs Node
- Internal node vs External node

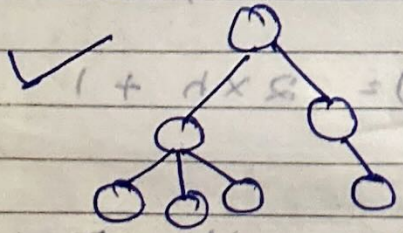
n → Degree of tree

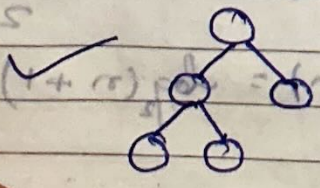
3-ary tree {0, 1, 2, 3}

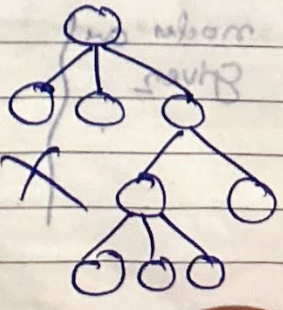


Strict 3-ary tree
{0, 3}



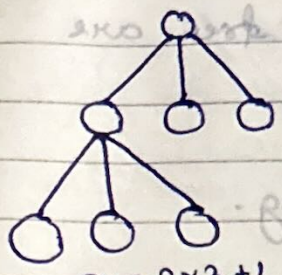






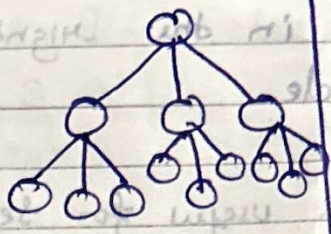
Strict 3 - ary Tree

min

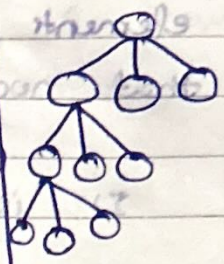


$n = 2 \times 3 + 1$

max

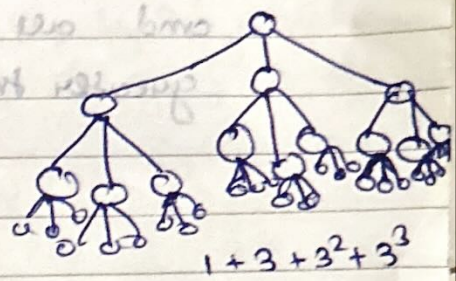


min



$n = 3 \times 3 + 1$

max



$1 + 3 + 3^2 + 3^3$

If Height is given

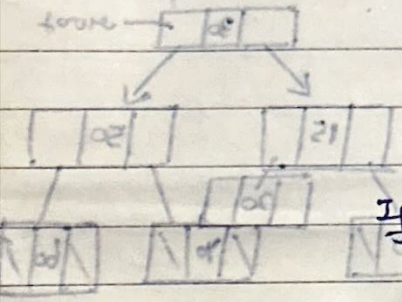
$= 1 + m + m^2 + m^3 + \dots + m^k$

Min nodes $n = 3 \times h + 1$

$n = mh + 1$

$= a\left(\frac{r^{k+1} - 1}{r - 1}\right)$

Max node $= \frac{(m^{h+1} - 1)}{m - 1}$

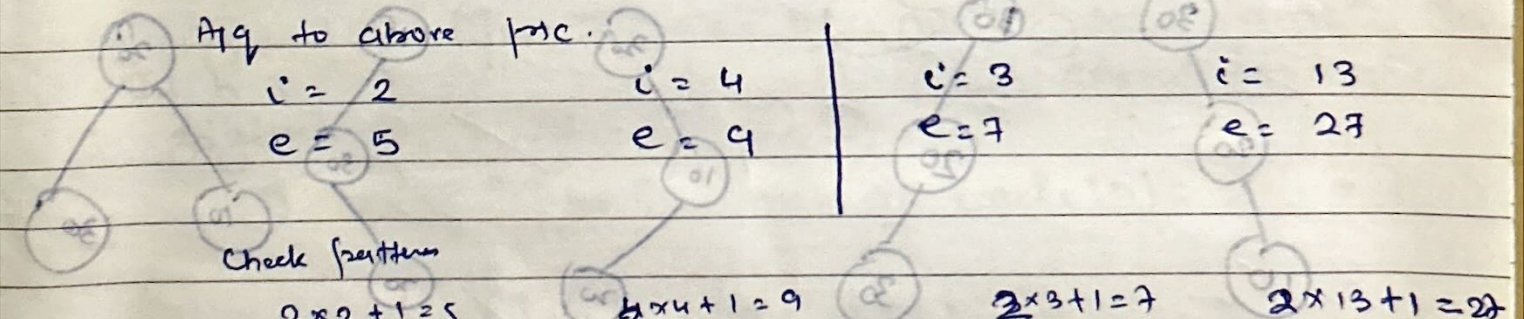


If 'n' nodes are given

Min Height $h = \log_m [n(m-1)+1] - 1$

Max Height $h = \frac{n-1}{m}$

No. of Internal / External Nodes



Acq to above pic.

$i = 2$, $e = 5$

$i = 4$, $e = 9$

$i = 3$, $e = 7$

$i = 13$, $e = 27$

Check pattern

$2 \times 2 + 1 = 5$

$2 \times 4 + 1 = 9$

$2 \times 3 + 1 = 7$

$2 \times 13 + 1 = 27$

$$e = 2 \times i + 1$$

$$e = (m-1)\,i + 1$$

$m \rightarrow$ no. of ary tree

(8)

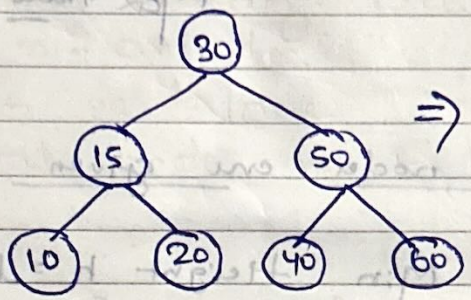
Binary Search Tree

Binary tree in which for every node all the node in left of tree are smaller than the nodes and all the elements in the right of tree are greater than that node.

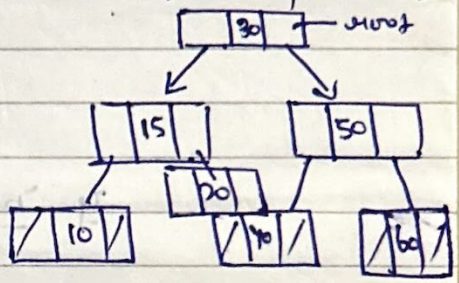
It is useful for searching.

properties

- No Duplicate
- In order give sorted order
- No. of BST for 'n' nodes



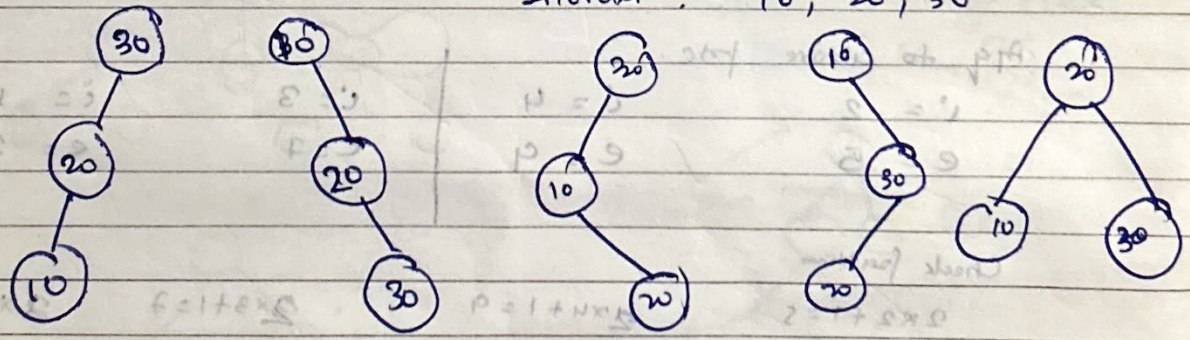
Linked Representation



Inorder :- 10, 15, 20, 30, 40, 50, 60

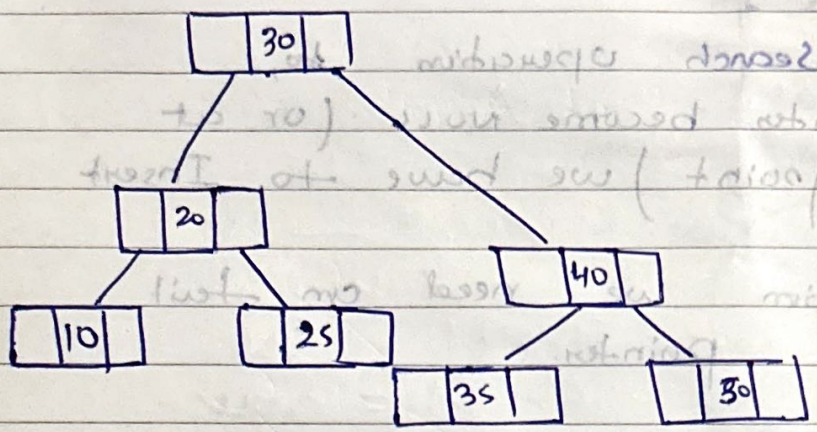
n = 3 (10) (20) (30)

Inorder :- 10, 20, 30



BST is represented using linked representation

Searching In BST.



```
void insert (Node *t, int key)
{
Node *r = NULL;
while (t != NULL)
{
r = t;
if (key == t->data)
```

Search (key = 25)

Take a pointer on the root of a node then check for the data and compare with key if it is smaller (key) then move to Left child then repeate same thing check and compare if it is greater then that then move to Right child ....

~~found~~

Max^m comparing of a data depend on height of tree O(h) time

$$\log n \leq h \leq n$$

If key is NOT found (NOT present)

When our pointer become NULL. mean's NOT FOUND.

Insertion In BST

First perform Search operation to, when our pointer become NULL (or at terminating point) we have to Insert

for Insertion we need an tail pointer.

```
Void Insert (NODE *t, int key)
{
    NODE *r = NULL;
    NODE *p;
    while (t != NULL)
    {
        r = t;
        if (key == t->data)
            return;
        else
            if (key < t->data)
                t = t->lchild;
            else
            {
                t = t->rchild;
            }
    }
    p = malloc (— );
    p->data = key;
    p->lchild = p->rchild = NULL;
    if (p->data < r->data)
        r->lchild = p;
    else
        r->rchild = p;
}
```

O(log n) time — same as height of tree

Recursive Search on BST

```
Rsearch (Node *t, int key)
{
    if (t == NULL)
        return NULL;
    if (key == t->data)
        return t;
    else if (key < t->data)
        return Rsearch(t->lchild, key);
    else
        return Rsearch(t->rchild, key);
}
```

Iterative function Search on BST

```
Node * Search (Node *t, int key)
{
    while (t != NULL)
    {
        if (key == t->data)
            return t;        (FOUND)
        else if (key < t->data)
            t = t->lchild;
        else
            t = t->rchild;
    }
    return NULL;        (NOT FOUND)
}
```

(2)

Recursive Insertion in B.ST.:

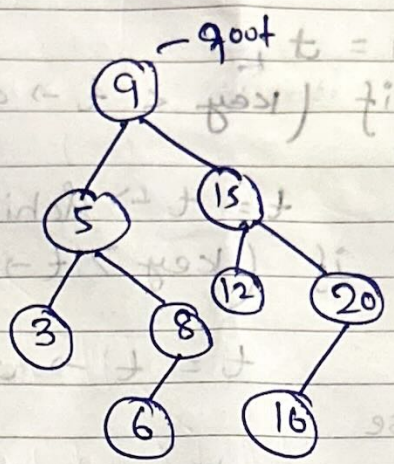
```
Node * insert (NODE *p , int key)
{
    Node *t;

    if (p == NULL)
    {
        t = malloc ( — );
        t -> data = key;
        t -> Lchild = NULL;
        t -> Rchild = NULL;
        return t;
    }
    if ( key < p -> data)
    {
        p -> Lchild = insert
                (p -> Lchild, key);
    }
    else
        if ( key > p -> data)
        {
            p -> Rchild = insert
                    (p -> Rchild, key);
        }
    return p;
}
int main ()
{
    NODE * root = NULL;
    root = insert (root, 30);
    insert (root, 20);
    insert (root, 25);

}
```

Create BST.

keys :- 9, 15, 5, 20, 16, 8, 12, 3, 6.



Insert → n element
for each
element we have
to search
→ that takes log n
So,
$= (n \times \log n)$
$= O(n \log n)$

BST in C.

```
# Include <stdio.h>

Struct NODE
{
    Struct NODE * lchild;
    int data;
    Struct NODE * Rchild;
} *Root = NULL;

Void Insert (int key)
{
    Struct NODE *t = Root;
    Struct NODE *r, *p;

    if (Root == NULL)
    {
        p = malloc (size of (struct node));
        p -> data = key;
        p -> lchild = p -> Rchild = NULL;
        Root = p;
        return;
    }
```

(14)

```
while (t != NULL)
{
    r = t;
    if (key < t -> data)
        t = t -> lchild;
    else if (key > t -> data)
        t = t -> rchild;
    else
        return;
}

p = (struct NODE *) malloc (sizeof(Node));
p -> data = key;
p -> lchild = p -> rchild = NULL;

if (key < r -> data)
{
    r -> lchild = p;
}
else
{
    r -> rchild = p;
}
}
```

```
Void Inorder (struct NODE *p)
{
    if (p)
    {
        Inorder (p -> lchild);
        printf ("%d ", p -> data);
        Inorder (p -> Rchild);
    }
}
```

```
int main()
{
    Insert(10);
    Insert(5);
    Insert(20);
    Insert(8);
    Insert(30);

    Inorder(root);

    printf("\n");

    struct NODE *temp;

    temp = search(20);
    if(temp!=NULL)
    {
        printf("Element %d is found", temp->data);
    }
    else
    {
        printf("NOT FOUND\n");
    }
    return 0;
}
```

Done

(16)

```
Struct NODE * Search (int key)
{
    Struct NODE *t = Root;
    while (t != NULL)
    {
        if (key == t -> data)
            return t;
        else if (key < t -> data)
            t = t -> Lchild;
        else
            t = t -> Rchild;
    }
    return NULL;
}
```

Deletion in B.S.T.

Search for the key If found then, delete it.

If you delete a NODE then, you have to make it's parent node as NULL;

If the node is getting deleted and it's having a one child then the child will take it's place.

If you want dlt root of tree then you have to find it's Inorder predecessor or Inorder Sucessor and replace any of them with root...

Find Inorder predecessor

Go to left's of tree and then go to at most right of it's.

Find Inorder Succesor

Go to Right's then, go to left at the last node.

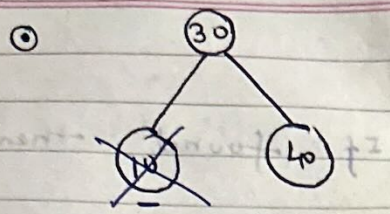
We were taking Inorder predecessor/sucessor bcz we wanted to avoid multiple modification in the tree

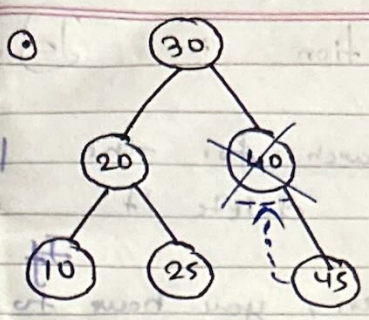
but sometime if Inordersucessor/predecessor is not a leaf node then you may have to make multiple modification

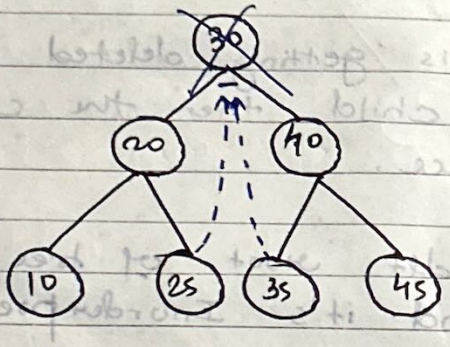
Time - O(logn)

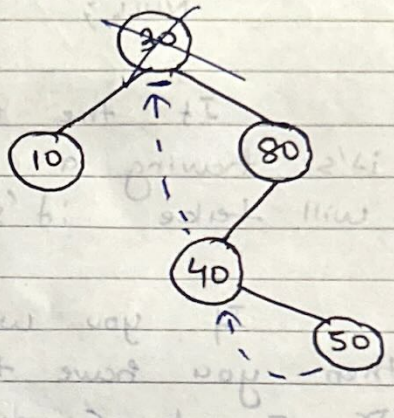
No. of modification - O(logn)

(18)









Recursive function of B.ST. Insertion

Add In previous program of Insertion in BST

```
struct NODE * RInsert ( struct NODE *p,
{ struct NODE *t = NULL;   int key)
  if (p == NULL)
  {
      t = (struct NODE *) malloc
      (sizeof (struct NODE));
      t -> data = key;
      t -> lchild = t -> rchild = NULL;
      return t;
  }
  if (key < p -> data)
      p -> lchild = RInsert (
          p -> lchild, key);
```

```
else if (key > p->data)
    p->rchild = RInsert(p->Rchild, key);
  return p;
}

int main()
{
    Root = RInsert(root, 10);
    RInsert(root, 30)
    RInsert(root, 5)
    RInsert(root, 20)
    RInsert(root, 8)
}
```

(1) Delete function in BST. Recursively

```
struct NODE * Delete(struct NODE *p,
                     int key)
{
    if (key < p->data)
        p->lchild = Delete(p->lchild, key);
    else if (key > p->data)
        p->rchild = Delete(p->Rchild, key);
    else
        if (Height(p->lchild) >
            Height(p->Rchild))
        {
            q = Inpre(p->lchild);
```

— Next page.

```
        p -> data = q -> data;
        p -> lchild = Delete (p -> lchild, q -> data);
    }
    else
    {
        q = Insucc (p -> Rchild);
        p -> data = q -> data;
        p -> rchild = Delete (p -> Rchild, q -> data);
    }
    return p;
  }
}
```

```
struct NODE * q;
If (p == NULL)
        return NULL;
if (p -> lchild == NULL && p -> rchild == NULL)
{
    if (p == root)
        root = NULL;
    free (p);
    return NULL;
}
```

```
int Height (struct NODE * p)
{
    int x, y;
    if (p == NULL)
        return 0;
    x = Height (p -> lchild);
    y = Height (p -> Rchild);
    return x > y ? x + 1 : y + 1;
}
```

```
struct NODE * Inpre (struct NODE *p)
{
    while (p && p -> Rchild != NULL)
        p = p -> Rchild;
    return p;
}

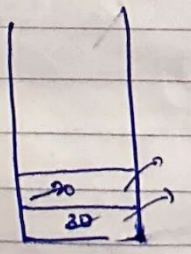
struct NODE *Insucc (struct NODE *p)
{
    while (p && p -> lchild != NULL)
        p = p -> lchild;
    return p;
}

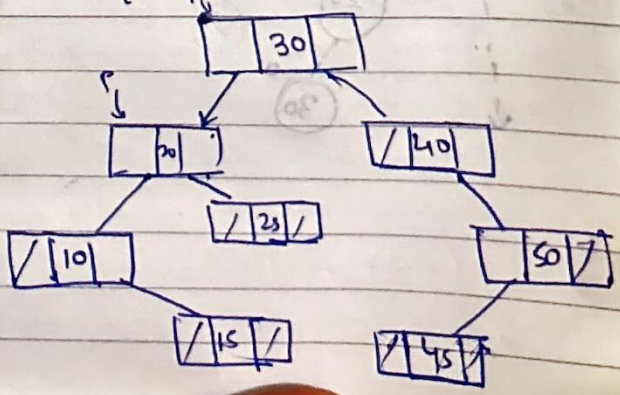
int main ()
{
    ----------
    ----------  // Insert
    ----------
    Delete (root, 20);
}
```

Generating BST from preorder.

① preOrder + {Inorder}
② postOrder + {Inorder}
(or)

Pre: | 30 | 20 | 10 | 15 | 25 | 40 | 50 | 45 |
     0   1   2   3   4   5   6   7





22

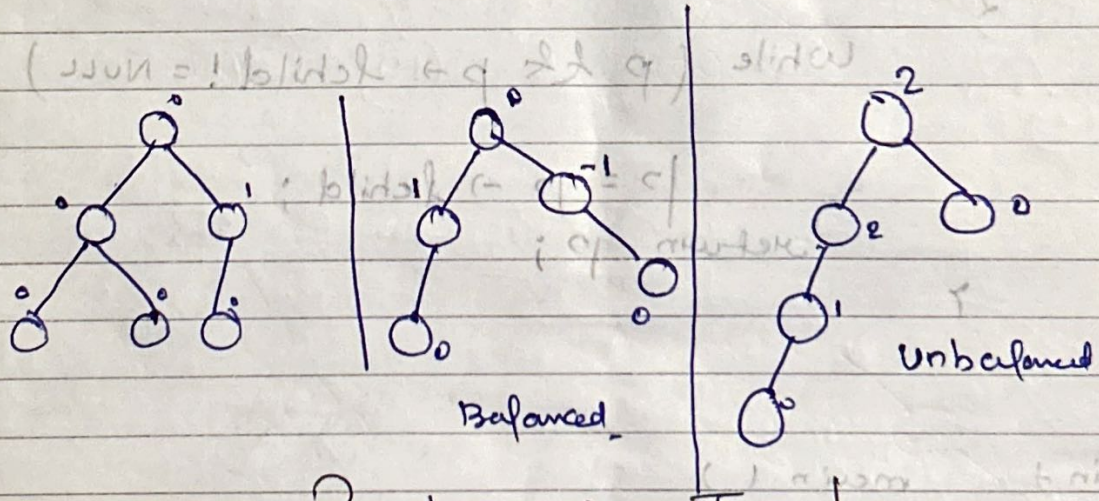
AVL Tree

Balance factor = Height of left subtree − Height of Right subtree.

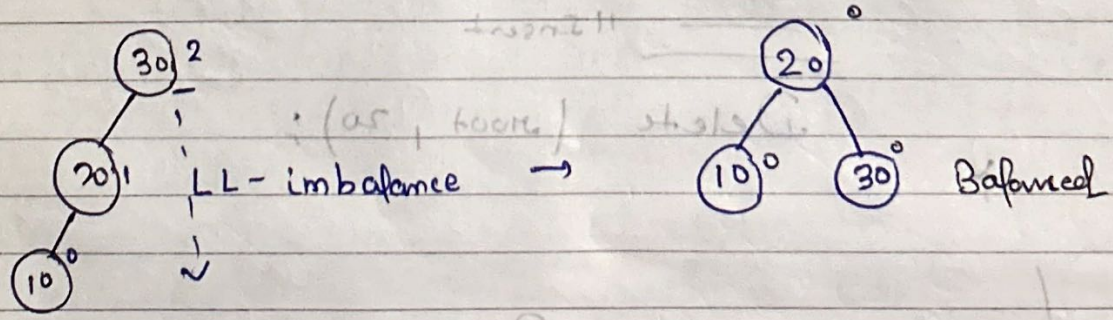
$BF = hl - hr = \{-1, 0, 1\}$

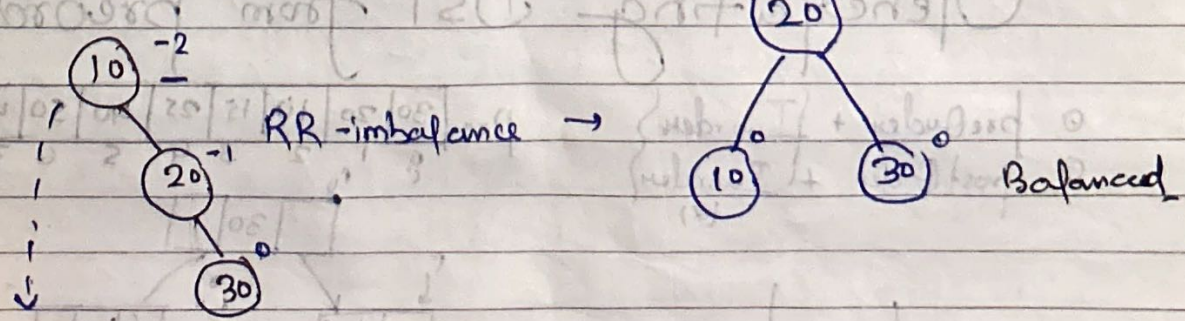
If $|BF| = |hl - hr| \leq 1$ balanced

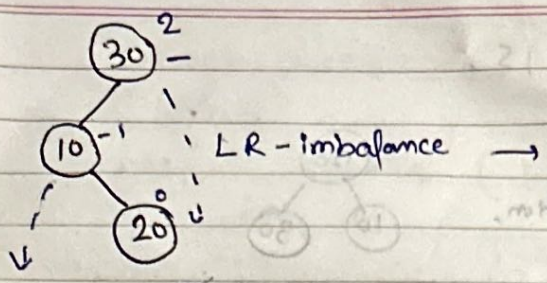
if $|BF| = |hl - hr| > 1$ imbalanced

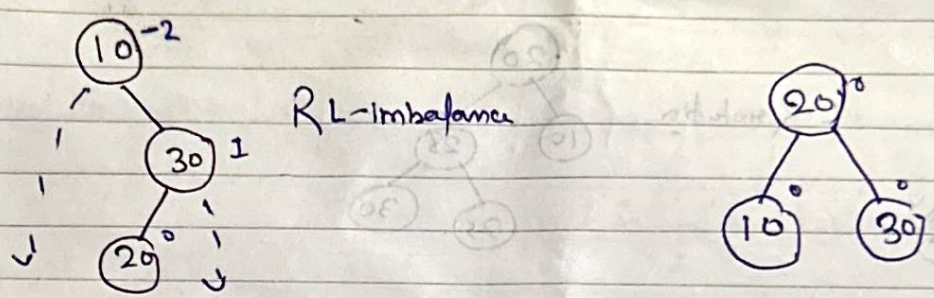


Rotation for Insertion

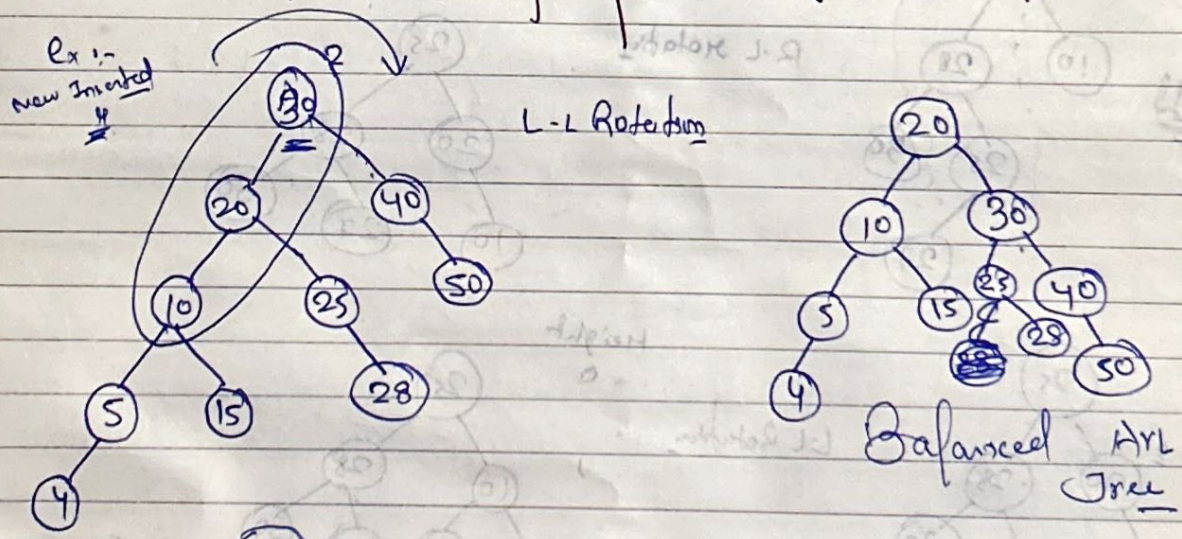


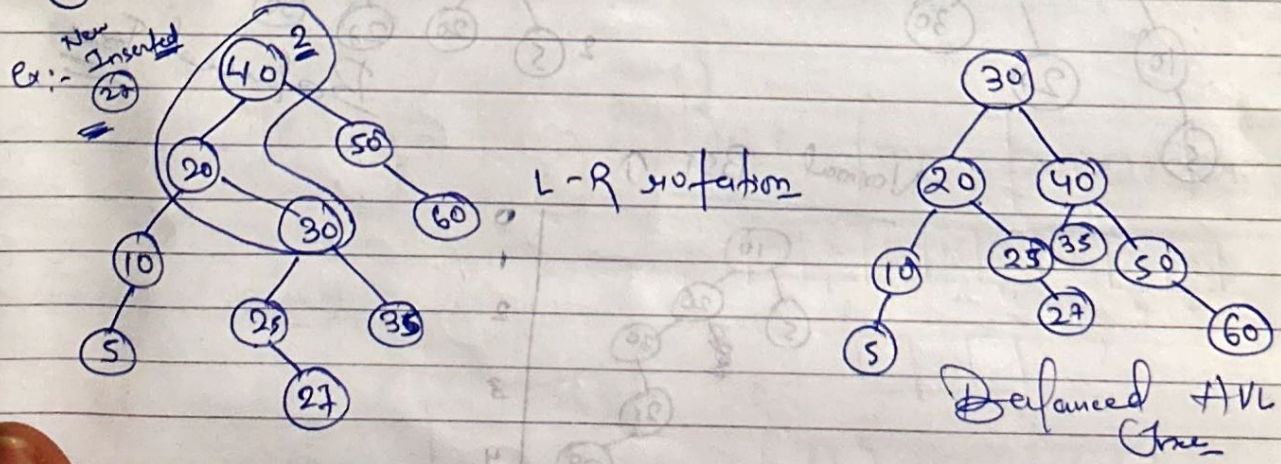






Formula of Rotation for Insertion

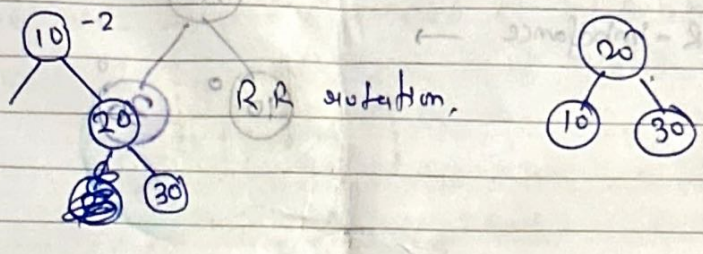


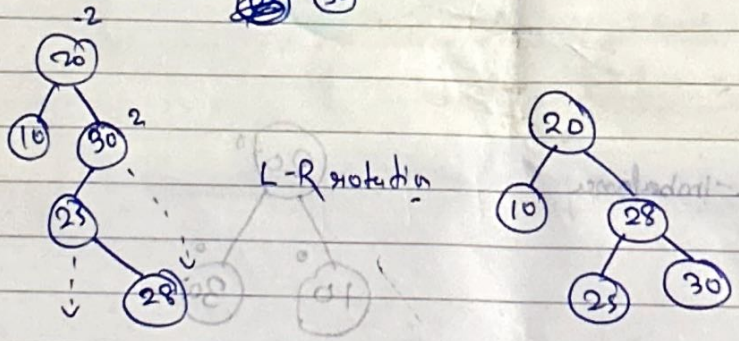


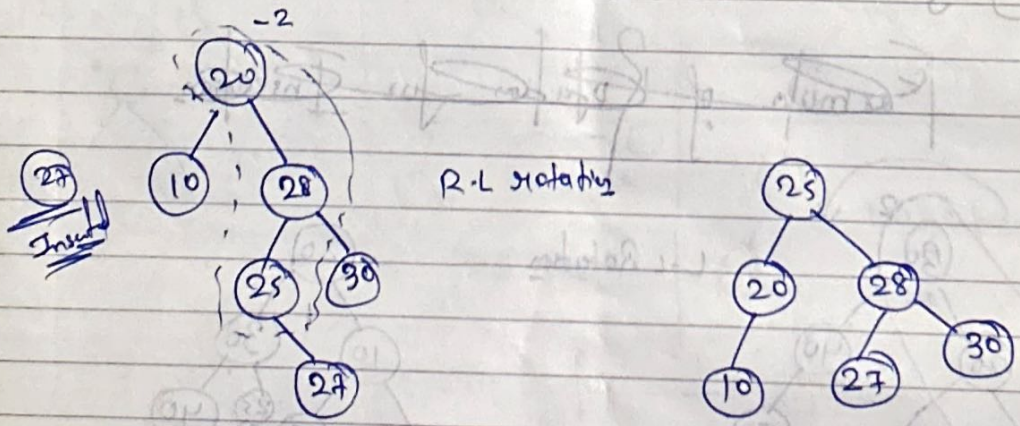
24

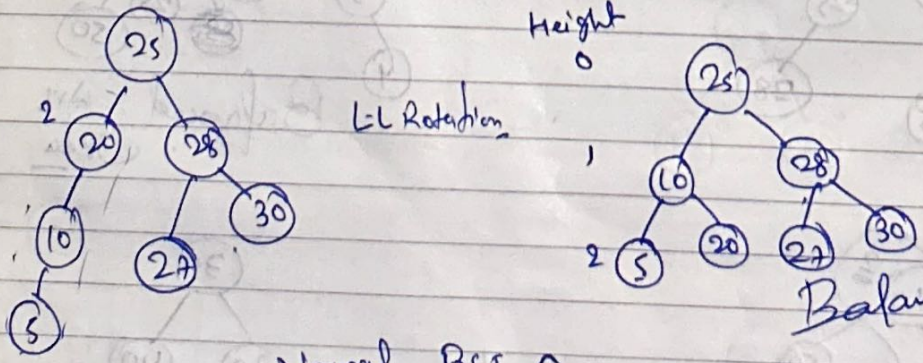
Create an AVL Tree

Key - 10, 20, 30, 25, 28, 27, 5.



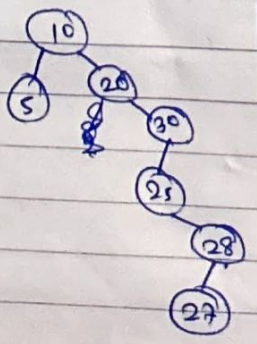






Balanced Tree

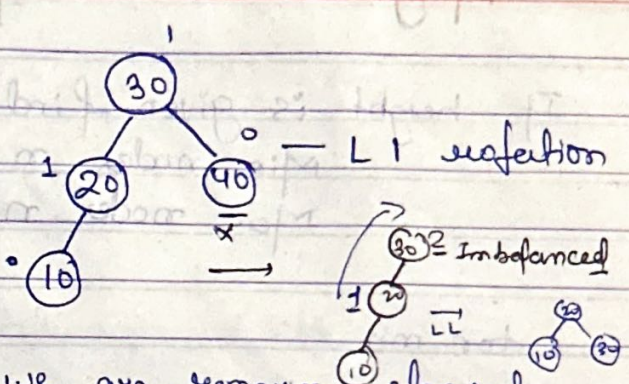
Normal BST ↑



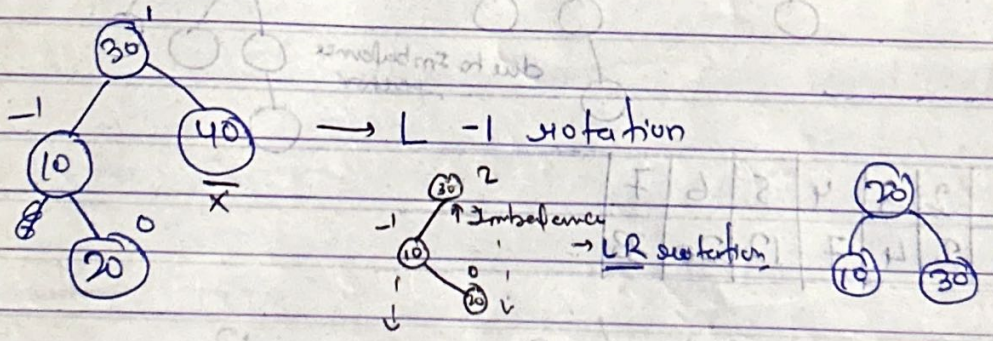
Deletion in AVL Tree

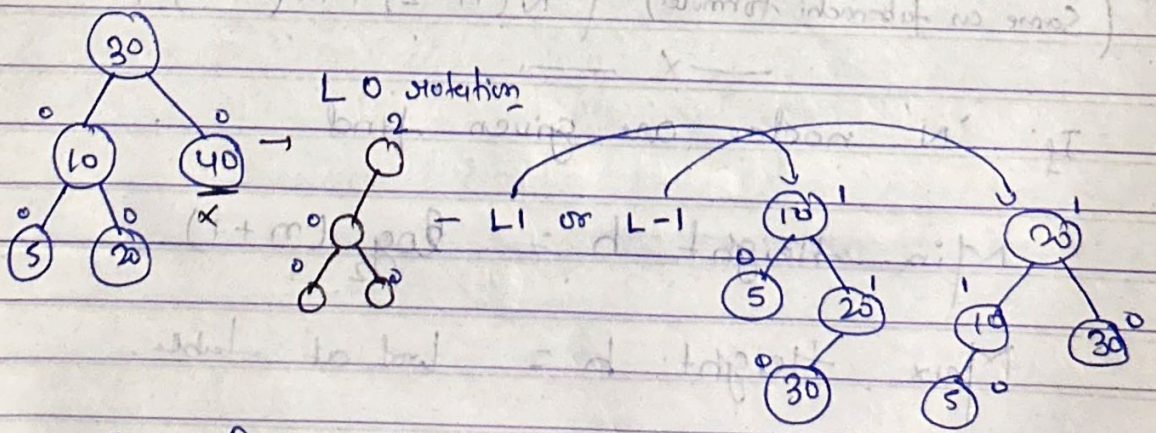
- Same as from BST

L 1 — Rotation
L -1 — Rotation
L 0 — Rotation



we are removing element from right hand side therefore it is getting Imbalanced from Left side.





- R1 R-1 R0 are same just the Mirror Img of these dft occur from left side and Imbalance to Right Side.

Height Vs Nodes of AVL Tree

If height is given find.

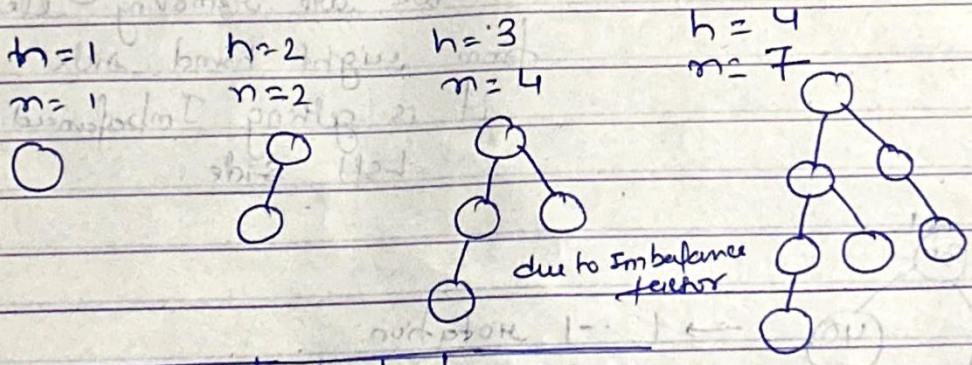
Min nodes n = $N(h-2) + N(h-1) + 1$

Max node $n = 2^h - 1$

bcz height is Starting from 1

for min

ex:-



h	1	2	3	4	5	6	7	...
N(h)	1	2	4	7	12	20	33	...

$$N(h) = \begin{cases} 0 & \\ 1 & \\ N(h-2) + N(h-1) + 1 & \text{otherwise} \end{cases}$$

(Same as fibonacci formula)

—x—

If 'N' nodes are given find

Min Height $h = \log_2(n+1)$

Max Height h = look at table.

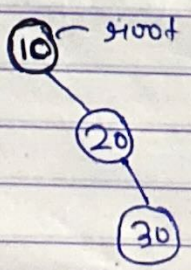
Red-Black Tree

- It is Height Balanced Binary Search Tree.
- Every Node is either Red or black
- Root of a Tree is always Black.
- Null are also taken as Black (leaf node)
- No. of blacks on paths from root to leaf are same.
- No 2 consecutive Red, parent and children of Red are Black.
- New Inserted node is Red.
- The height of a red black tree
  - ↳ $\log n \leq h \leq 2 \log n$

Create Red black tree

Key - 10, 20, 30, 50, 40, 60, 70, 80, 45, 48

↳ Insertion take place just like BST



root i.e. ~~red~~ black

Always Inserted node is red

Now his parent or child both are red

So, we have to adjust

- ↳ re colouring
- ↳ rotation.
